Question text

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

For example:

Input	Result
hello world ad	1

Question text

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

- For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string *s* that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

Input: *s* = "AAAAACCCCCAAAAACCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCC", "CCCCCAAAAA"]

Example 2:

Input: *s* = "AAAAAAAAAAAA"
Output: ["AAAAAAAAAA"]

For example:

Input	Result
AAAAACCCCCAAAAACCCCCAAAAAGGGTTT	AAAAACCCCC CCCCCAAAAA

Answer:(penalty regime: 0 %)

```
1 s=input()
2 n=set()
3 p=set()
4 for i in range(len(s)-9):
5     c=s[i:i+10]
6     if c in n:

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to **K**.

Examples:

Input: t = (5, 6, 5, 7, 7, 8), K = 13
Output: 2
Explanation:
Pairs with sum K(= 13) are {(5, 8), (6, 7), (6, 7)}.
Therefore, distinct pairs with sum K(= 13) are { (5, 8), (6, 7) }.
Therefore, the required output is 2.

For example:

Input Result

1,2,1,2,5 1
3

Answer:(penalty regime: 0 %)

```
1 def fun(t,k):
2     s=set()

4     for n in t:
5         c=k-n
6         if c in s:
7             p.add(tuple(sorted((n,c))))
8         s.add(n)
9     return len(p)

Question 7

Question text

You are given an integer tuple `nums` containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:

- 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
- 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

Constraints

- The input tuple `nums` contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple `nums` as input and return the total number of operations as an integer.

Example:

Input: `nums = (3, 4, -1)`
Output: 5

Explanation:
Operation 1: `[3, 4, -1]` -> First element is not the smallest, move to the end -> `[4, -1, 3]`
Operation 2: `[4, -1, 3]` -> First element is not the smallest, move to the end -> `[-1, 3, 4]`
Operation 3: `[-1, 3, 4]` -> First element is the smallest, remove it -> `[3, 4]`
Operation 4: `[3, 4]` -> First element is the smallest, remove it -> `[4]`
Operation 5: `[4]` -> First element is the smallest, remove it -> `[]`
Total operations: 5

For example:

Test	Result
<code>print(count_operations((3, 4, -1)))</code>	5

Answer:(penalty regime: 0 %)

Reset answer

```
1 def count_operations(nums: tuple) -> int:
2     # Your implementation here
3     op=0
4     nums=list(nums)
5     while nums:
6         if nums[0]==min(nums):
7             nums.pop(0)
8         else:
9             nums.append(nums.pop(0))
10        op+=1
11    return op
12
```
